Parties by their camps: joint modes of the illicit and legal drug scores

Per party a 2D Gaussian mixture (mclust, VVV with prior) on the respondents' mean scores; weighted centroids.
Two logos (dotted line between them) when BIC prefers two components by > 10 and the smaller one holds ≥ 15%; grey dot = party mean.
Logo size and n = respondents per component (share × party n). Split: D66, PVV, GroenLinks-PvdA. Dashed lines = sample means.

Every party's two-component solution

Forced two components per party; point size = respondents in the component, label = share.
Faded: BIC or share rule not met, so page 1 shows the party mean.

Mixture decision per party next to the remode modes on the map axes

Drawn twice: BIC difference > 10 and smaller component ≥ 15%

party	n	BIC 2 vs 1 component	drawn twice	remode modes, illicit (x)	remode modes, legal (y)
GroenLinks-PvdA	240	19.8	yes	1	2
D66	234	40.1	yes	2	1
VVD	132	0.1		1	3
PVV	124	81.1	yes	2	2
CDA	114	7.0		1	1
JA21	79	3.3		1	2
SP	42	-10.6		1	1
FvD	37	-7.0		1	1
PvdD	36	5.9		2	2
BBB	33	-4.8		1	1
Volt	28	2.9		1	1
SGP	20	-4.1		1	1
50PLUS	19	2.9		1	1
CU	15	1.0		1	2
